

UTM

UNIVERSITI TEKNOLOGI MALAYSIA

Academic Writing on Project Management and System Development

Course Code: SECP1513

Lecturer's Name: DR ARYATI BINTI BAKRI

Group's Name: SANTAI PRO MAX

Titles of the Topics :

- Description Of The Speaker Experience
- What Is Project Management And System Development
- How the Project Management and System Development Has Been Used In Program
- Reflections

Speaker TS. HJ ABDUL ALIM BIN ABDUL MUTTALIB

NAMA	NO MATRIKS
Ian Victor Anak Nehemiah Belanda Kumbang	A25CS0233
Nasaaie Bin Noriskamar	A25CS0118
Farhan Ashraf Bin Fakhrul Anwar	A25CS0059
Norsufiyah Aliyah Binti Md Johaimi	A24SC0215

Description Of The Speaker Experience

TS. HJ Abdul Alim Bin Muttalib, Head of Technology and Innovation for Serunai Commerce Sdn Bhd who introduced the audience to project management and system development. Said speaker within the talk had studied in University Teknologi Malaysia and graduated with a Computer Science (Database System) degree, accumulating knowledge about computer science as a basis for his upcoming journey. He carries a significant amount of proper training shown by having a license and certificate as a professional technologist from Malaysia Board of Technologist after obtaining practical experience when it comes to developing systems in relation technology and technical fields which further solidifies his understanding of technology, project management and leadership altogether. His skills express itself as he had experience in project management as regional information technology manager at Rich Products Malaysia and Product Development Manager (AI) at Genaxis Group Sdn Bhd where he is required to apply his training in planning, scheduling, managing and communicating. His experiences as managers for different companies eludes him surmounting real world challenges with a complete understanding of managing a substantial amount of projects which sequentially allowed him to currently have an executive role. All things considered, he can effortlessly explain briefly about project management and system development through his profound comprehension by relaying information through analogies and demystifying complex topics.

What Is Project Management And System Development

Project Management is the foundation of every system development. It is the first aspect that needs to be carefully broken down before starting a project. Without proper project management, failure is likely to occur. For instance, engineers need proper planning from architects before building a bridge. This is where project management plays an essential role. System Development is the entire process of defining, designing, testing and implementing a software application. Meanwhile, System Development Life Cycle (SDLC) ensures the project is running and helps address any problems that occur during its development. It focuses specifically on the design aspect within the broader. SDLC aims to create detailed design specifications and plans that serve as a blueprint for the development team.

How the Project Management and System Development Has Been Used In Program

In many industries that are involved with any programming and coding, Software Development Life Cycle (SDLC) is frequently used for turning complex problems into functional software that can easily be used. Without these steps, any tasks would turn into chaotic problems. In the bioinformatics industry, this management has been used for thoroughly deep research about any biological databases and finding the statistical needed for data analysis. Other than that, in Computer Graphics, it focuses more towards using the right tools with the specific wanted designs. For example, writing a code and fixing it over and over again until the animation is smooth with the right programming languages.

Project management plays an important part in the computer science field such as Data Engineering, Computer Networks and Security and others. In Data Engineering, project management is important on organizing the data pipelines development, including data collection, cleaning, modelling and even on coordinating team roles. Proper management of these tasks is essential to ensure everything is delivered efficiently and meet the clients requirements. Agile methods are often used in this field as it is easier to make changes and handle those changes to allow further improvements throughout the project.

In Computer Networks, project management is essential for designing the projects, implementation of the products, managing risk and documenting all the requirements and configuration for a network infrastructure. It helps in defining the project scope, coordinating tasks, and meeting deadlines. Effective risk management is also applied to minimize errors such as network failures and security breaches. By using proper project management, network projects can be completed within budget and according to client requirements while producing high quality solutions.

Reflections

Nasaie Bin Noriskamar

Attending industry talks made me realize that an IT career is not just about coding, but also about project and system management skills. I also understood that successful projects go through the SDLC phase and that AI is increasingly taking over routine tasks, so the role of my skills needs to be expanded and enhanced to keep up. I will use the SDLC methods which are planning, designing and testing before starting the project. These talks motivated me to learn early, master both technical and management skills, and ensure that the systems I build are secure and reliable.

Farhan Ashraf bin Fakhru Anwar

Attending Serunai's industry talk highlighted the importance of system development and project management in computer science fields. The talk emphasized that computer science is not limited to programming, writing codes, learning new programming languages, but also involves problem solving, managing complex problems and understanding the development processes. In my opinion, to be successful in this field, it is essential to master not only programming skills, but also problem solving skills, system development skills. Technical skills alone are insufficient without the true understanding of concepts such as the Software Development Cycle. As a closure, Serunai's industry talk really opened my eyes and provided valuable insights to the key of what is required in the computer science field and helped me clarify my goals for the future.

Ian Victor Anak Nehemiah Belanda Kumbang

An industry talk program, specifically from the head of technology and innovation of Serunai Commerce Sdn Bhd gave me numerous insights about protocols when developing any system. This talk reminded me of the unpredictability and chaotic nature of our world and how it significantly affects long term projects. In order to maintain relevancy of any projects, project managers utilize agile project management where they accept future technologies and changes by only publishing small updates to a base product within small but flexible cycles to continuously meet customer demands and receive feedback. To ascertain my previous point, an example of agile project management being applied is from a game company called Mojang with their most commercially accepted product being Minecraft, a 3D sandbox adventure game. Mojang implements small, manageable updates by adding small features every 2 to 3 months to keep their player enlivened. This also proved to be less risky when it comes to encountering any major bugs within Minecraft due to less code entanglement and shortened documentary for each update. Overall I'm satisfied with gaining knowledge that not only rectify my view on project management but shed light on grounded expectation when it comes to entering the workforce.

Norsufiyah Aliyah Binti Md Johaimi

This industry talk has opened my eyes about the importance of both system development and project management in the computer science industry. Inside this industry, the speaker emphasizes a lot about the importance of project planning starting from the ideas, then to the designing of the complex solution to the problem, then finally to the testing. He also tells about the importance of good teamwork skills to prevent any chaotic problems occurring inside the team synergy. Other than that, I also learned about various types of skills that I need to master such as problem solving skills, programming languages skills, and more. The reason for this is because as stated by the speaker, These skills will be implemented in industry, not only on the FYP Project in the final years later on. Therefore, I will definitely use up the information and advice given by him to apply it inside my future work-force.
